Exploring Al-Assisted Features and Built-In Analytics (Zia) in Zoho Creator

Project: Insurance Claim Management System

Experiment No	09
Name	Adishwar Seelan S.K
Roll No	241401004
Department	CSBS

1. Aim

To explore the Al-assisted and built-in analytics capabilities of Zoho Creator, powered by Zia, Zoho's Al assistant, by reviewing the dashboard, conditionally formatted reports, and Kanban-grouped views of the Insurance Claim Management System, and to understand how these features turn raw form data into actionable visual insight without writing custom code.

Objectives

- To review the application dashboard and its summary data.
- To study how conditional formatting highlights values with colour so patterns are visible at a glance.
- To study Kanban report views as a built-in way to group records without any scripting.
- To review the Claim Request Report as the underlying data that the dashboard and Kanban views are built on.
- To understand Zia's role within Zoho Creator in generating chart suggestions, building dashboard layouts, and surfacing data insights.

Software / Tools Required

- Zoho Creator platform.
- Insurance Claim Management System application in Zoho Creator.
- Web browser.
- Zoho account with permission to access the application in Access/Live mode.

Zoho Creator

Zoho Creator includes analytics components that turn form records into visual summaries without any separate BI tool. A Dashboard page can combine summary tiles, pie and bar charts, and embedded reports in one view; individual reports can use conditional formatting to colour rows or cells by field value; and a Kanban report groups records into columns by a chosen field. All of these read live data directly from the application's forms, so the visuals update automatically as records are added or changed.

Zia - Zoho's Al Assistant

Zia is the Al layer built into the Zoho ecosystem, including Creator. Within Creator, Zia-driven features assist application builders by suggesting appropriate chart types for a given report, helping generate dashboard layouts from existing forms, and surfacing trends that would otherwise need manual analysis. Rather than requiring the developer to hand-code every chart, Zia-assisted suggestions speed up the process of turning a plain data table into a meaningful visual summary.

Key Concepts

- **Dashboard:** A custom page combining summary tiles, charts, and embedded reports into a single, auto-refreshing overview of application data.
- **Chart Widget:** A visual element (pie, bar, donut, etc.) bound to a report that summarises records by a chosen field, such as Claim Type or Claimant Type.
- **Conditional Formatting:** A report-level rule that colours a cell or row automatically based on its value, making important values stand out without manual review.
- **Kanban Report:** A board-style report that groups records into columns by a selected field (e.g. Claim Type), letting staff scan records visually.
- **Zia Insights:** Al-assisted suggestions within Zoho Creator that recommend chart types, help assemble dashboard layouts, and highlight patterns in the underlying data.

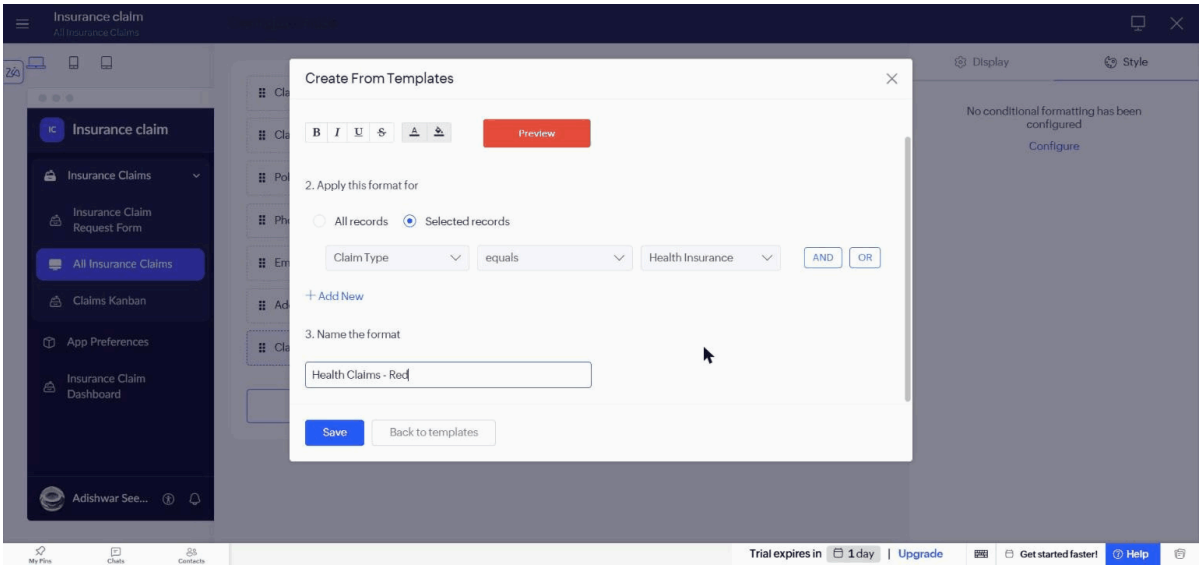

Application Specifications

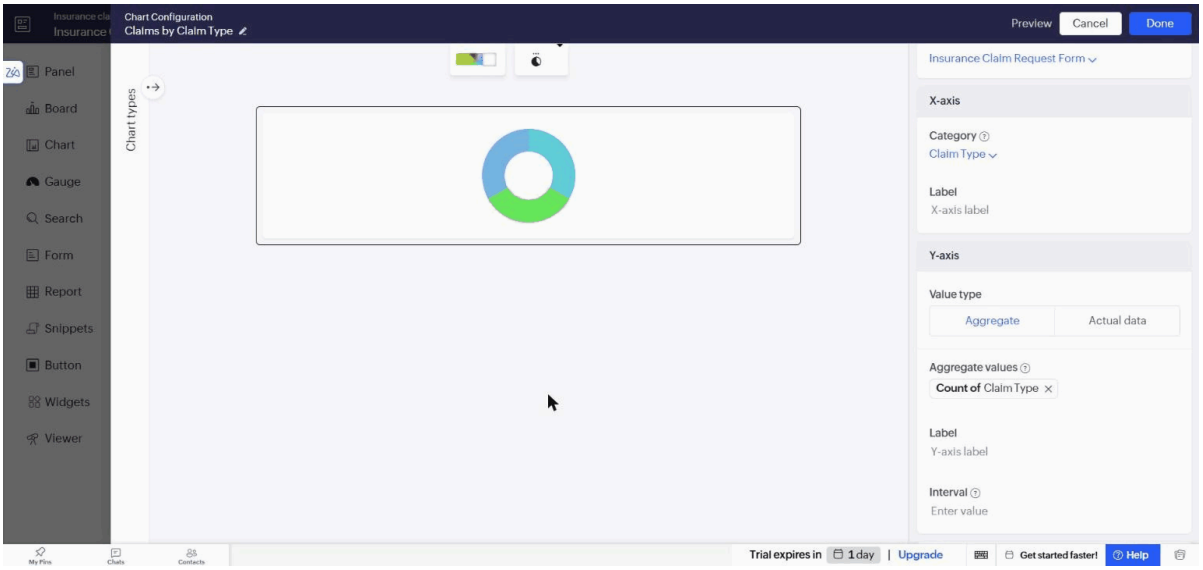

- **Application Name:** Insurance Claim Management System
- **Primary Form:** Insurance Claim Request Form (Claim Request Form)
- **Dashboard Elements:** Summary tiles (e.g. total claims) and chart widgets (e.g. claims by Claim Type)
- **Conditionally Formatted Report:** Claim_Request_Report (coloured by Claim Type or Claim Status)
- **Kanban Report:** Claims grouped by Claim Type

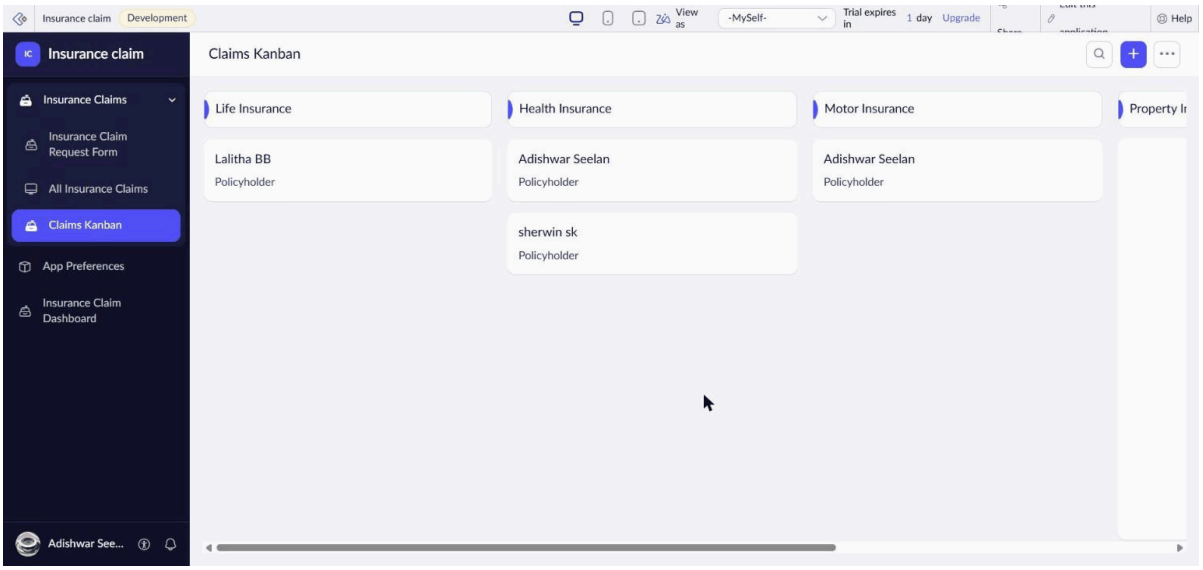

- **Data Report:** Claim_Request_Report (Claimant Name, Policy Number, Claim Type, Date of Incident, Claim Amount, Claimant Type, Contact Number)

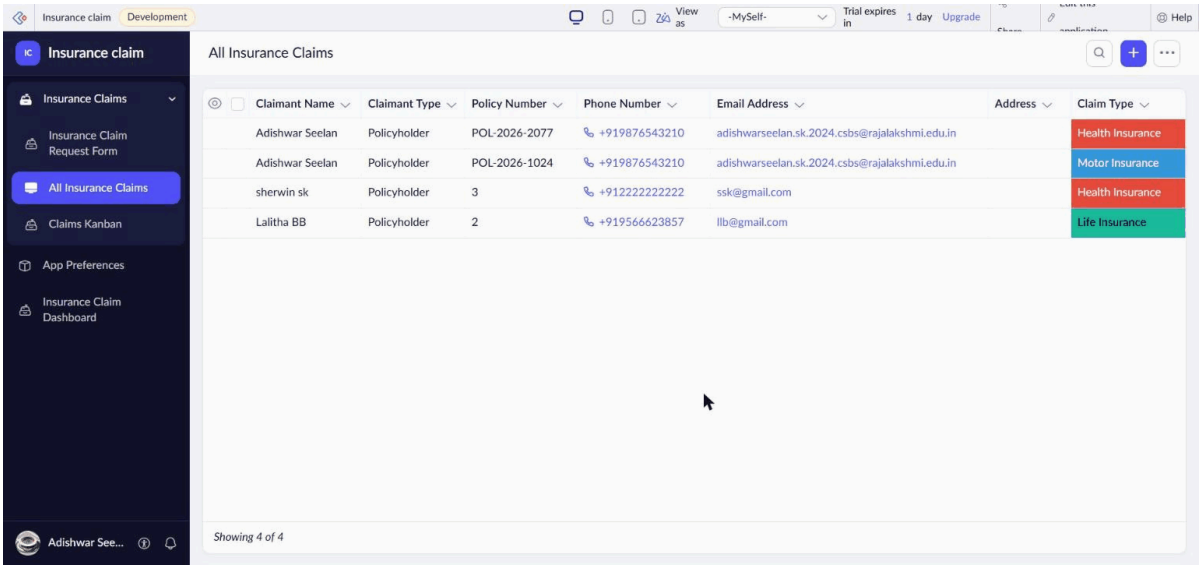

2. Procedure

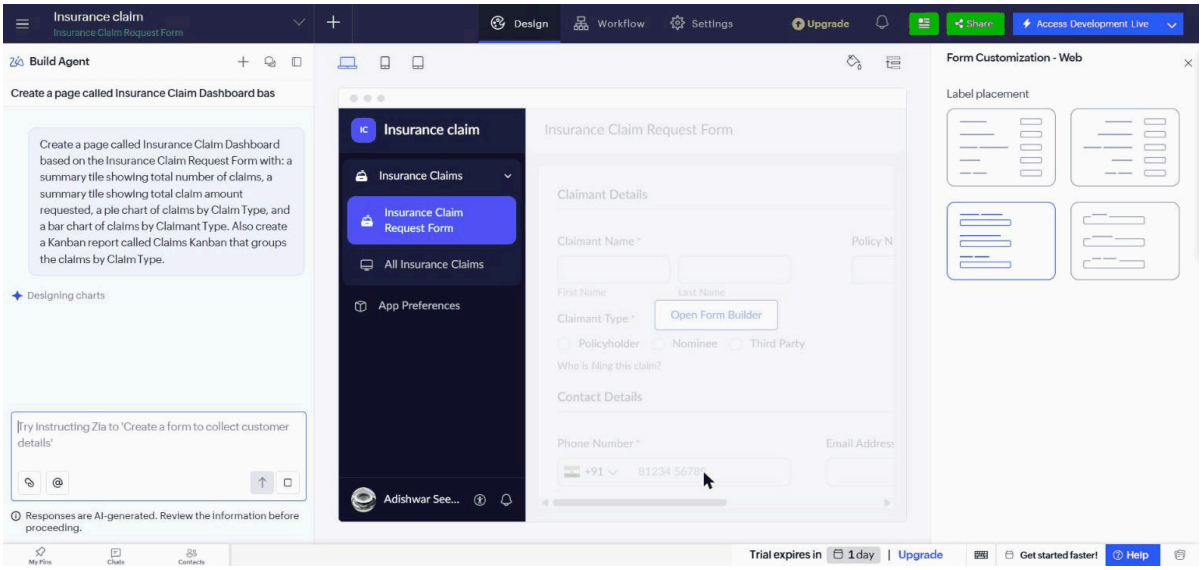

1. **Open the application dashboard**
   The Insurance Claim Management System was opened in Access mode and its Dashboard was reviewed. The dashboard summarises claim records into tiles and charts using live form data.
2. **Inspect the conditionally formatted report**
   The Claim_Request_Report was opened and conditional formatting was applied so that a chosen column, such as Claim Type, is colour-coded automatically by value.
3. **Switch to the Kanban view**
   A Kanban report was opened, grouping the claim records into columns by Claim Type.
4. **Review the chart widgets**
   The chart widgets on the dashboard were reviewed to see how claims are distributed by a chosen field, and the chart type suggested by Zia was observed where available.
5. **Review the underlying claim data**
   The Claim_Request_Report was reviewed to confirm the structured data (claimant, policy number, claim type, amount, date) that the dashboard and Kanban views are built on.

3. Result

3.1 The Insurance Claim Management System's Dashboard was reviewed, confirming it summarises claim data into live tiles and charts without manual configuration.

3.2 Conditional formatting was applied to the Claim_Request_Report, colouring values automatically to highlight patterns.

3.3 A Kanban report view was reviewed, confirming claim records can be grouped and browsed visually by a chosen field.

3.4 The Claim_Request_Report was reviewed as the structured data underlying these analytics.

4. Conclusion

The experiment demonstrated how Zoho Creator's built-in analytics and Zia-assisted features convert plain form records into decision-ready visuals with no custom charting code. The dashboard's tiles and charts give an instant overview of claim volume and distribution, conditional formatting turns a flat table into a scannable map of claim types, and Kanban reports let the claims team browse the same data as a visual board. Together these features show that low-code analytics in Zoho Creator is a natural extension of the same forms and reports built in earlier experiments.
