# Configuring User Management and Role-Based Access Control (RBAC) in a Zoho Creator Application

**Project:** Insurance Claim Management System

| | |
|---|---|
| **Experiment No** | 8 |
| **Name** | Adishwar Seelan SK |
| **Roll No** | 241401004 |
| **Department** | CSBS |

## 1. Aim

To configure user management and Role-Based Access Control (RBAC) in the Insurance Claim Management System developed using Zoho Creator by creating different user roles and assigning appropriate permissions to control access to insurance claim forms, reports, dashboards, and claim processing operations.

### Objectives

- To review the Insurance Claim Management application and identify its forms, reports, and dashboards.
- To create different roles for insurance claim processing, such as Claims Administrator, Claims Reviewer, and Claims Officer.
- To configure permission sets according to the responsibilities of each role.
- To restrict unauthorized users from approving or rejecting claims and modifying important claim records.
- To configure report and dashboard access for authorized users.
- To test the application using different user roles and verify that the configured access permissions work correctly.

### Software / Tools Required

- Zoho Creator platform.
- Insurance Claim in Zoho Creator.
- Web browser

- Zoho account with permission to edit the application and configure user management settings.

## Creator

User management determines who can access an application and what operations they can perform. In the Insurance Claim Management System, users are assigned appropriate permissions based on their responsibilities in the insurance claim process.
For example, a Claims Administrator can manage the application, a Claims Reviewer can assess submitted claims, and a Claims Officer can enter and maintain claim information.

## Role-Based Access Control (RBAC)

Role-Based Access Control is a security model in which permissions are assigned according to a user's role rather than granting identical access to every user. RBAC helps protect sensitive insurance information, prevents unauthorized modifications, reduces accidental deletion of claim records, and ensures that users can perform only the operations required for their duties.

## Key Concepts

- **Users:** Individuals authorized to access the Insurance Claim Management application.
- **Permissions:** Rules that determine whether users can create, view, edit, or delete records and access application components.
- **Roles:** Organizational positions assigned to Claims Reviewer, and Claims Officer.
- **Role Hierarchy:** A structure that determines how extended between roles, depending on
- **Data Sharing:** Rules that grant additional record visibility or access to specified users or roles.
- **Least Privilege:** The principle of providing users only the access necessary to perform their responsibilities.

## Application Specifications

- **Application Name:** System
- **Primary Form:** Request Form
- **Main Fields:** Claimant Name, Claimant Email, Policy Number, Claim Type, Incident Date, Claim Amount, Supporting Documents, and Claim Status, where available
- **Roles:** Claims Administrator, Claims Reviewer, Claims Officer
- **Access Control:** Form permissions, report permissions, record access, and role-based restrictions

# 2. Procedure

### Step 1: Open User Management

The Insurance Claim Management application was opened in edit mode. The Users and Permissions or User Permissions section was accessed to configure application users, roles, and permission settings.

### Step 2: Create Roles

Three roles were planned for the application:

- **Claims Administrator:** Responsible for application administration and overall claim management.
- **Claims Reviewer:** Responsible for examining submitted claims and updating review decisions.
- **Claims Officer:** Responsible for entering new claims and maintaining claim information.

These roles separate administrative, review, and data-entry responsibilities.

### Step 3: Configure Administrator Permissions

The Claims Administrator was assigned the permissions required to manage the application and its claim records. Depending on the application's configuration, this may include creating, viewing, editing, and deleting records and managing reports. Administrative access was restricted to authorized users.

### Step 4: Configure Claims Reviewer Permissions

The Claims Reviewer was assigned access to view submitted claims and update review-related information, such as claim status and reviewer comments. Access to unrelated application settings and user-management functions was restricted where supported by the configured permission settings.

### Step 5: Configure Claims Officer Permissions

The Claims Officer was assigned permissions to create and view claim records and edit permitted claim information. Deletion of claim records and unauthorized changes to review decisions were restricted where supported by the application configuration.

### Step 6: Configure Report Access

The Insurance Claim Report was configured, if available, to provide access according to each role's responsibilities. The Claims Administrator was given the required administrative access, while the Claims Reviewer and Claims Officer were provided only the report access necessary for their work.

### Step 7: Configure Dashboard Access

The Insurance Claim Dashboard was made available to authorized users, where a dashboard had been created. The dashboard can display claim counts, claim status distribution, and other useful summaries without unnecessarily exposing sensitive claimant information.

### Step 8: Add Users and Assign Roles

Test users were added to the application, and each user was assigned the appropriate role and permission set. Separate test accounts were used where possible to verify the access available to the Claims Administrator, Claims Reviewer, and Claims Officer.

### Step 9: Test Role-Based Access

The application was tested using the different user roles. The ability to create, view, edit, and delete claim records was checked against the configured permissions. The reviewer's ability to update claim decisions and the officer's restrictions on sensitive operations were also checked.

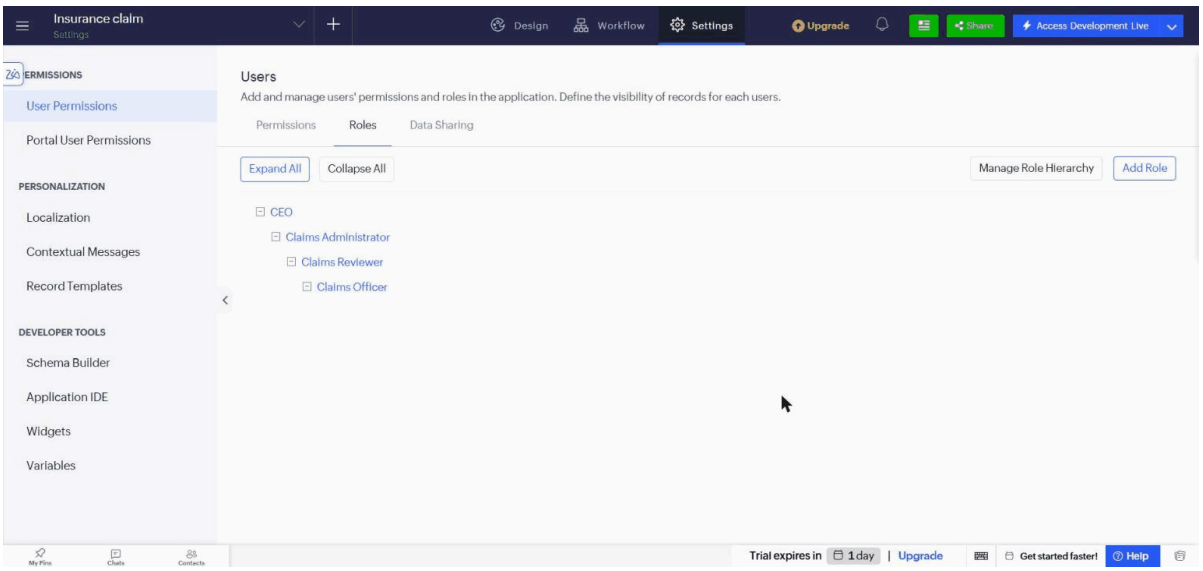

### Step 10: Verify Restricted Access

The application was tested to confirm that users could not access unauthorized administrative functions or perform operations beyond their assigned permissions. Any incorrect permissions were reviewed and corrected before the configuration was considered complete.

## 3. Output

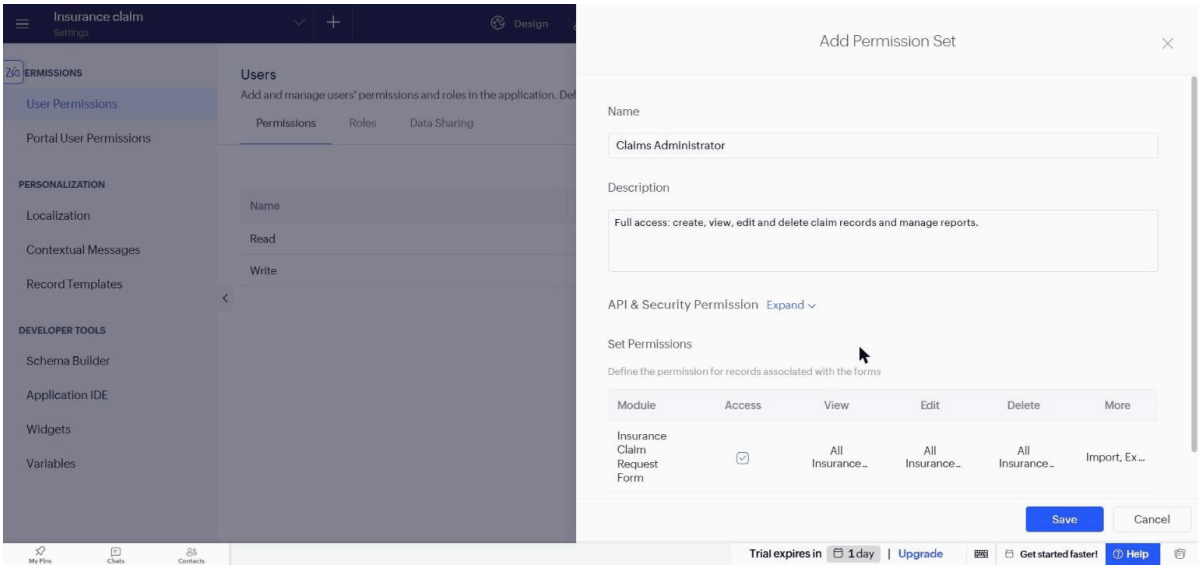

### 3.1 Creating User Roles

The Claims Administrator, Claims Reviewer, and Claims Officer roles were configured or prepared in the Insurance Claim Management application. These roles represent the main responsibilities involved in processing insurance claims.

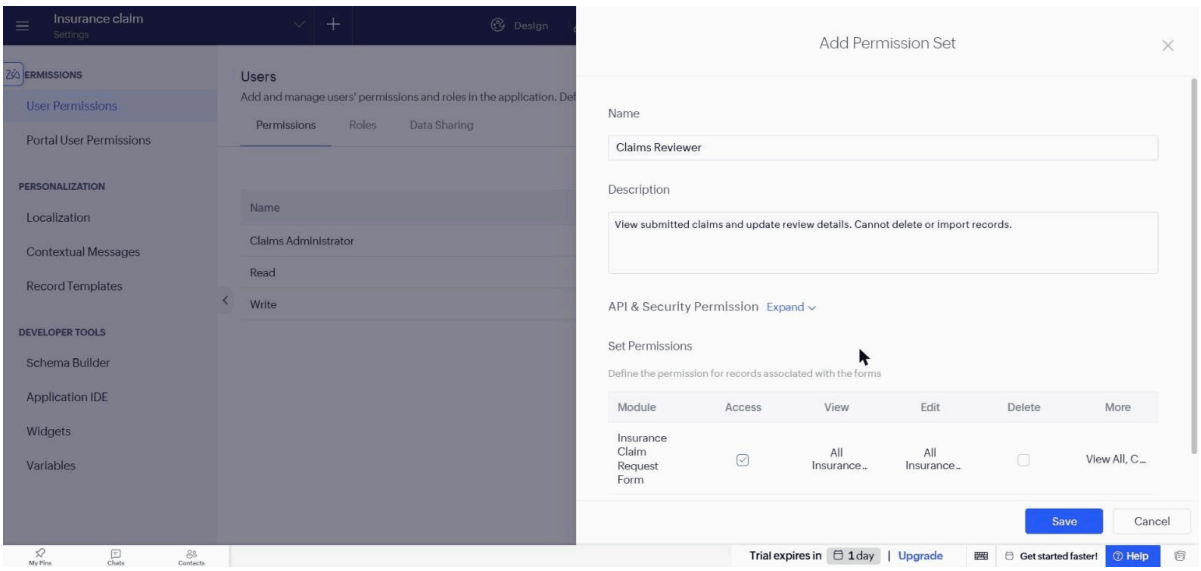

## 3.2 Configuring Administrator Permissions

The Claims Administrator was assigned the permissions required to manage claim records and application components. Access to administrative operations was limited to authorized users.

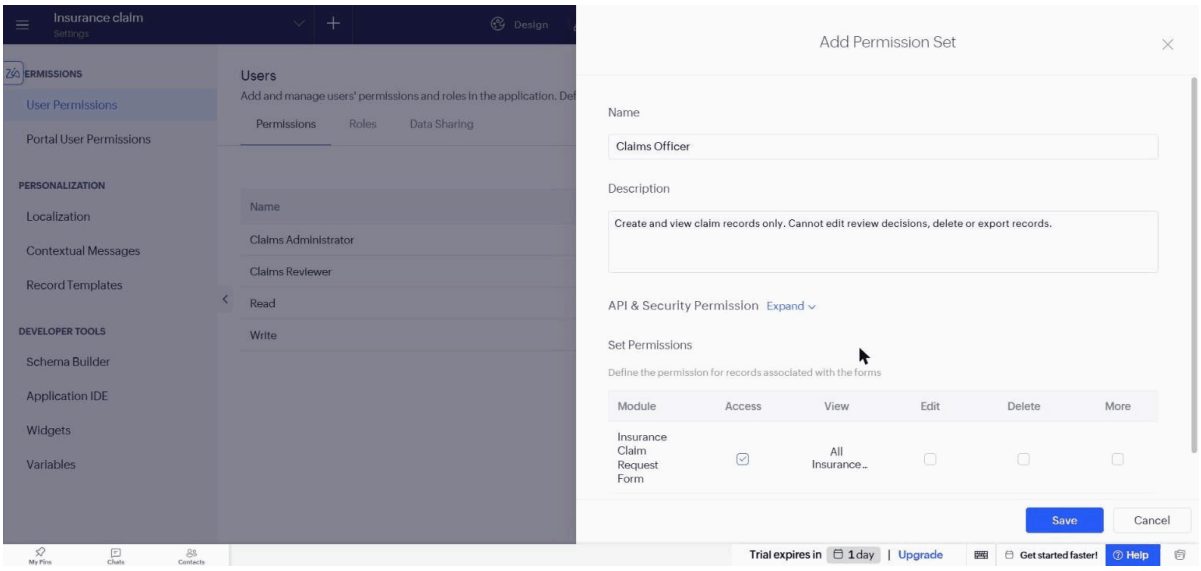

## 3.3 Configuring Reviewer Permissions

The Claims Reviewer was assigned access to submitted claims and permitted review operations. Permissions were configured to reduce unauthorized access to administrative settings and unrelated records.

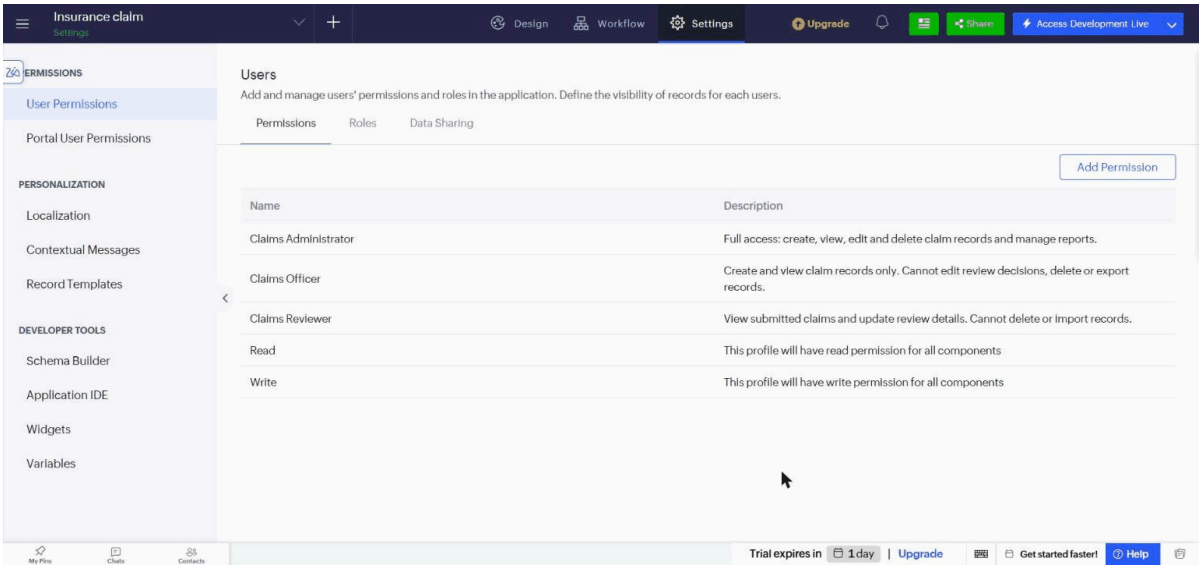

## 3.4 Configuring Claims Officer Permissions

The Claims Officer was assigned the required permissions for entering and viewing claim information. Restricted operations were limited according to the configured permissions.

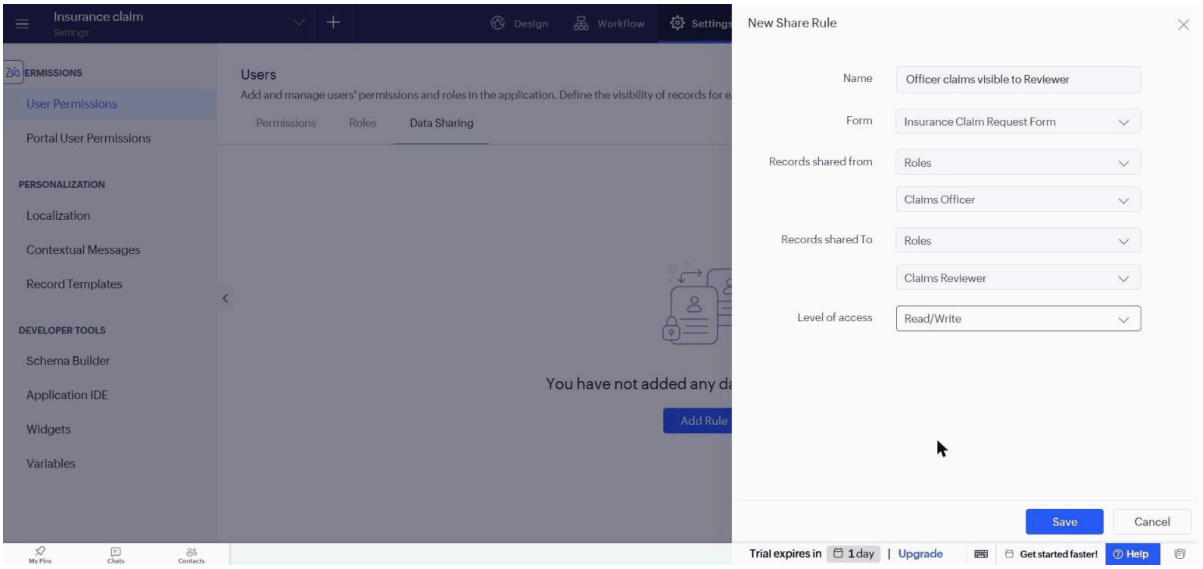

## 3.5 Configuring Report and Dashboard Access

Access to the Insurance Claim Report and dashboard was configured according to the responsibilities of each role, where those components were available in the application.

## 3.6 Testing Role-Based Access

The application was tested using the configured user roles. The available operations were checked to verify that users received the appropriate access to claim records and application components.

## 3.7 Verifying Restricted Operations

Restricted operations, including unauthorized deletion and access to administrative settings, were tested using a limited-permission account. The results were checked against the intended access policy.

# 4. Final Result

User management and Role-Based Access Control were configured or prepared for the Insurance Claim Management System in Zoho Creator. The application uses separate roles

for Claims Administrator, Claims Reviewer, and Claims Officer to organize access according to job responsibilities. Form, report, and record permissions help protect insurance claim information and reduce unauthorized operations. The configured permissions were tested using the available user accounts and application features. Thus, the experiment demonstrates how user management and role-based access control can be applied to improve the security and organization of an insurance claim processing application in Zoho Creator.
