Deploying a Zoho Creator Application from Development to Production Environment

Project: Insurance Claim Management System

Experiment No: 11
Name: Adishwar Seelan SK
Roll No: 241401004
Department: CSBS

1. Aim

To deploy the Insurance Claim Management System built in Zoho Creator from the Development environment to the Stage environment for testing, and then to the Production environment, so that a tested and approved version of the application is live and available to end users.
The application manages insurance claim requests, acknowledgement emails and claim reports, so changes must be reviewed and tested before they reach live users.

2. Procedure

Step 1: Review the application in Development
The dashboard and reports of the Insurance Claim Management System were checked in the Development environment to confirm that the application was ready for deployment (Section 3.2).

Step 2: Open the Environments page
Deploy > Environments was opened. The application showed the Stage and Production columns along with the label indicating that changes were available to publish (Section 3.3).

Step 3: Select components for Stage
Publish > Publish to Stage was chosen. The modified components of the application were selected and the Development and Staging code was compared side by side (Section 3.4).

Step 4: Enter the publish details
A title, description, version type and email notification address were entered, the version change was confirmed and the application was published (Section 3.5).

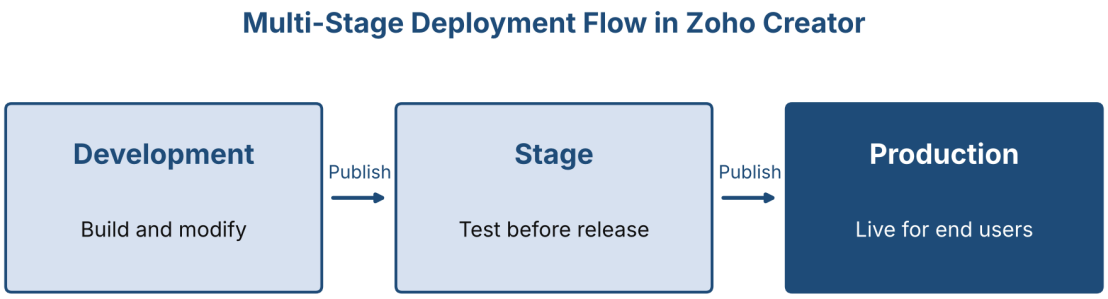

Step 5: Stage deployment confirmation
The "Publish to Stage initiated" message and the completion email from Zoho Creator were checked (Section 3.6).

Step 6: Publish to Production
After testing in Stage, Publish to Production was started and the Environments page was used to track it (Section 3.7).

Step 7: Verify the live application
The Production environment, its version, its Live status and the Deployment Progress panel were verified (Section 3.7), and the results were summarised (Sections 3.8 and 3.9).
Note: version numbers, dates and times are reported as shown on screen. Feature names and menu options depend on the Zoho Creator plan and version.

3. Output

3.1 Multi-stage deployment model

Changes move one environment at a time (conceptual diagram)

Zoho Creator provides three environments. Development is where the application is built, Stage is a testing copy, and Production is the live copy used by end users. A change is published to one environment at a time, so untested work never reaches live users.

3.2 Application overview (Development dashboard)

The dashboard of the Insurance Claim Management System was reviewed in the Development environment before deployment, showing the claim data summary.

3.3 Environments page

The Environments page lists the application with Stage and Production columns. The label showing that changes were available confirmed that Development had changes ready to publish.

3.4 Selecting components and comparing versions

In the Publish to Stage window, the modified components were selected. The code view shows Development and Staging side by side for each modified component.

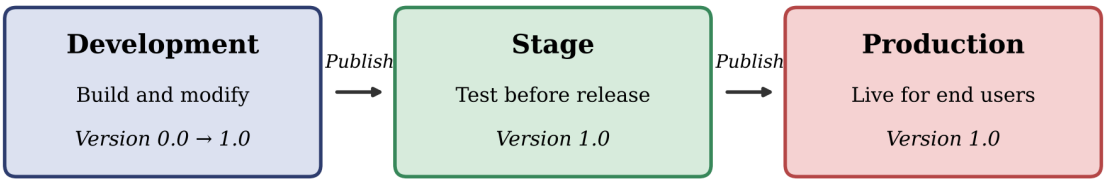

3.5 Publish details

The title, description and version type were entered and email notification was enabled. The version change was confirmed. A warning stated that the application will be in maintenance mode and inaccessible until publishing is complete.

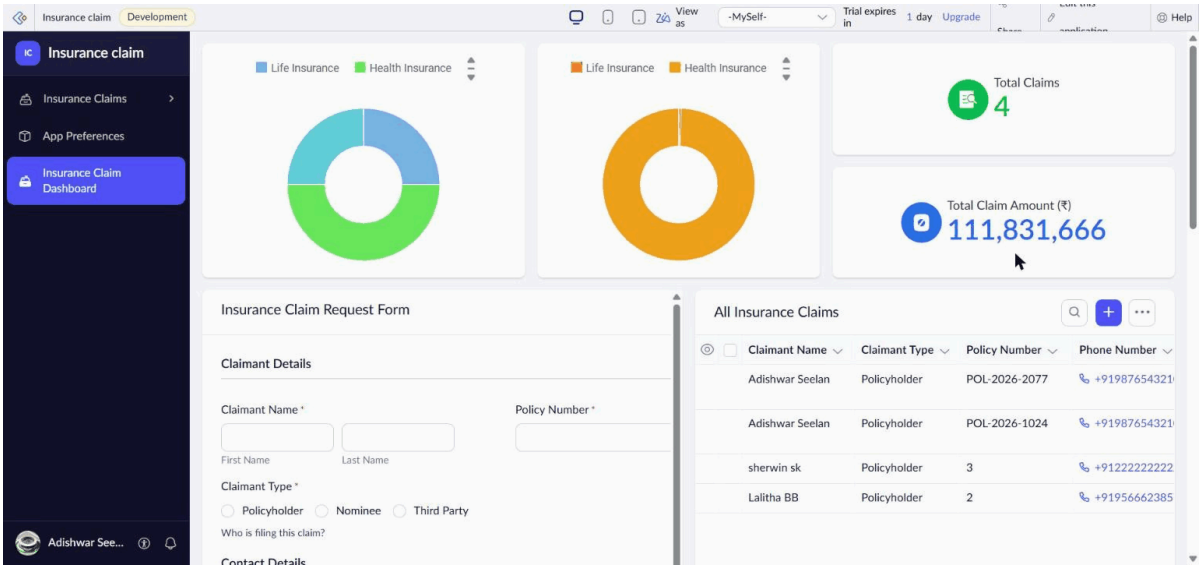

3.6 Stage deployment confirmation

After clicking Publish, Zoho Creator displayed "Publish to Stage initiated" and noted that the process takes a few minutes. A completion email from Zoho Creator confirmed that the version was published successfully.

Multi-Stage Deployment Flow in Zoho Creator

Changes move one environment at a time; the application is in maintenance mode while publishing.

3.7 Production deployment and live status

The tested version was then published to Production. The Environments page showed the Production environment with the status Live.

3.8 Deployment summary

Environment	Version	Date	Status	Description
Development	1.0	Oct 8 2026	Deployed	Application configured and ready for deployment
Stage	1.1	Oct 9 2026	Deployed	Application tested and approved in Stage
Production	2	Oct 9 2026	Live	Application live and accessible to end users

3.9 Deployment practices followed

The deployment followed good release practice: components were reviewed and the Development and Staging code compared before publishing; the version was tested in Stage before Production; each release carried a clear title, description and version type; email notification was enabled and received; the maintenance-mode warning was noted; and the Live status and Deployment Progress panel were checked after publishing.

4. Final Result

The Insurance Claim Management System was deployed through the Zoho Creator multi-stage process. The modified components were reviewed and published from Development to Stage, confirmed by the Zoho Creator completion email. After testing, the application was published to Production, where the Environments page shows it as Live. The exercise met its objective of deploying a Zoho Creator application from the Development environment to the Production environment using controlled, traceable steps.
